

Fabspeed Motorsport has just completed the installation of our Dynojet 424xLC<sup>2</sup> AWD dynamometer at our location and is now offering Dyno testing/tuning services. Our dyno is equipped with a Wideband Air/Fuel Ratio meter, and Datalink Module for OBDII Applications. The Datalink module provides real time data from the OBDII port on all 1996 and newer vehicles, and is recorded into each dyno run.

The Model 424xLC<sup>2</sup> can handle all the popular rear wheel drive, front wheel drive and sophisticated AWD vehicles on the road today. Along with offering the precise control from the eddy current load absorption units, the system eliminates any potential speed bias between the two drums. This virtue is critical when dyno testing the latest computer controlled AWD systems.

Fabspeed Motorsport offers a full range of dyno testing options for your 2WD or 4WD vehicle. There is an initial fee of \$150 for operational use of the dyno. If you have any questions or would like to setup an appointment feel free to contact us.
